It appears to me that this conclusion, at any rate so far as direct infection from mouth to mouth is concerned, is justified by the following considerations: --a. That the statistical evidence for such infection is almost valueless. For it has been shown that the number of cases of supposed infection falls short of what it should be, even on the hypothesis that the disease is not contagious (see the result of the application of Dr. Longstaffs formula, in the Collective Investigation Record). b. That most, if not all, the cases recorded are placed out of court by the impossibility of ascertaining that they were due to direct infection, and that they did not arise from the presence in the dwellings of tuberculous material under the form of dust. c. That if phthisis be directly conveyed from...
